Crop Insurance Decisions in an Era of Increased Volatility

Bruce Sherrick
sherrick@illinois.edu
University of Illinois
Crop Insurance issues:

- New price levels and volatility render traditional commodity support programs less effective for management of revenue risk.
- Crop insurance viewed as risk management “cornerstone” with increased importance of effective usage. Product subsidy and selection issues of increased importance.
- Indemnity Price determination, impact of interactions with marketing decisions, new limits, and divergence of base from expected prices increases importance.
Major decision issues:

- Farm-based vs. Area-based products
- Revenue or Yield insured
- If Revenue, option for guarantee value to increase with price increases or fixed at signup.
1. Yield insurance
   - Actual Production History (APH) pays based on the number of bushel shortfall times (cash intent) price

2. Revenue without guarantee increase
   - Revenue Assurance – Base Price (RA-BP) and IP pay when a revenue index from yield times futures price is below guaranteed revenue.

3. Revenue with guarantee increase
   - Crop Revenue Coverage (CRC) and Revenue Assurance – Harvest Price (RA-HP) pay when crop revenue index is below yield times the higher of base price or harvest price. Essentially includes the option on price increasing in the guaranteed revenue.
**County-Level Products**

1. **Yield insurance**
   - Group Risk Plan (GRP) pays when county average yields are below elected fraction of expected level.

2. **Revenue without guarantee increase**
   - Group Risk Income Plan (GRIP) pays percentage shortfall in county-based revenue index (average yield times average futures price) times an available revenue level. The Maximum protection can be very high.

3. **Revenue with guarantee increase**
   - GRIP-HR, like GRIP but with additional feature that guaranteed revenue increases if prices increase.
Revenue Insurance “Prices”

“Base” Price:
- Corn – CBOT Dec. contract avg. in February
- Soybeans – CBOT Nov. contract avg. in Feb.

“Harvest” Price:
- Corn – CBOT Dec. avg in October (CRC, GRIP) and November (RA)
- Soybeans – CBOT Nov. contract avg. in October
Revenue insurance pays when “available” revenue index is below guaranteed level – **not** your actual revenue. Marketing gains/losses against springtime fall futures need to be considered.

Increase in guaranteed revenue if Harvest Price is greater than Base Price (embedded call option*) has value, but can be offset by difference between futures and average Feb futures.

Increase in guarantee good for “aggressive” users of forward contracts or futures contracts

*max price change for 2009 and beyond is to 2 times base price, no down side limit*
Group Plan features

- Indemnity based on county yields, not own farm yields
- Group Plans (GRP, GRIP, GRIP HR) – county insurance products may work well if yields are highly correlated with county’s. Does NOT matter if your yields are higher or not.
- Easy to administer, often works well for farms spread over large regions.
- Not settled until county yields are final in following year.
- Payments can be very large due to 1.5 factor in maximum liability, high resulting “leverage” in protection.
- High prices, low yields, average revenue often results in high payments under GRP and GRIP-HR, but not GRIP; High yields, low prices, both GRIP and GRIP-HR can make high payments but not GRP.
Premiums (costs of insurance products) are federally subsidized. Subsidy rates are set in the Agricultural Risk Protection Act of 2000 and can be adjusted annually. Subsidy rates vary by coverage level and type of insurance.

2009 Subsidy Schedule (Group products had subsidy rates reduced most)

Example – a producer’s total premium for Corn Crop Revenue Coverage is $84/acre at 70% coverage. The producer pays $34.44 and the federal government pays $49.56. If accurately rated, producers should make more in payments than they pay in premiums over time.
Crop insurance companies receive administrative and operating (A&O) subsidies from the Federal government for delivering crop insurance products. These subsidies are set by the SRA and averaged about 21.6% across all policies in 2007, a bit lower in 2008, and potentially much lower in 2009.

2008 A&O Subsidies, % of Tot. Prem.

Revenue products include CRC, RA and IP. Group products include GRP and GRIP. Proposed reductions in A&O subsidy of 2-5% go into effect beginning in 2009 unless rescinded. Vary by LR experience. Group likely reduced to 12% across all.

</table>
What *might* happen in 2009?…

- Prices may increase during Feb and result in indemnity price (average) **below** final price.
  - *Increases value of HR products*
  - *Decreases chance of revenue products paying*
- Prices may decrease during Feb and result in indemnity price (average) **above** final price.
  - Increases chance of revenue products paying
- Average and final prices are the same.
  - *Cubs win World Series.*

*IL Averages based on iFARM simulation models*
Future Issues:

- Enterprise unit subsidy adjustment in 2009 – intended to more nearly equalize dollar subsidy to that under basic/optional units.
- Conversion of price limits (CRC, GRIP, RAHP) to 2*base price and no downside limit. No treatment of ave-Feb vs. end-of-Feb prices....
- Revised A&O, reduced group policy subsidy rates.
- BE and related endorsements simplified/expanded.
- Potential New Products, “Combo” in 2011
- Base and indemnity price convergence – 2011.
